

## 1. Plain T<sub>E</sub>Xnology

**Theorem T.** *All things are not necessarily the same\**

## 2. Permutations

TAoCP in chapter 1.2.5 gives two methods to generate all permutations of a given ordered set. Quantities of permutations are considered with relevance to computing efficiencies.

## 3. The Wide-Awake example Group

We re-think\*, re-word, and re-start with a set of attributes, elements or objects,  $W = \{ \text{woozy, vacuous, sleepy, wide-awake} \}$ . These elements are used to generate all possible arrangements  $\eta$  which are ordered  $n$ -tuples with  $1 \leq n \leq 4$ . For example,  $\eta = ( \text{woozy, wide-awake} )$  is a 2-tuple. Now the set Woozy is the set of all permutations that jumble such elements like  $\eta$ .

Let  $(\text{Woozy}, \circ, 0, -)$  be the group with the set Woozy, a binary operation  $\circ$ , a neutral element 0, and for each element  $\pi \in \text{Woozy}$  there is an inverse element  $-\pi \in \text{Woozy}$  such that  $\pi \circ -\pi = 0$ .

For now, here, we call this group's binary operation *composition*. Given two elements  $\pi, \eta \in \text{Woozy}$ , then  $\pi \circ \eta \in \text{Woozy}$  and  $\eta \circ \pi \in \text{Woozy}$ .

#### 4. Creating the Woozy set

**Theorem X.** *An ordered set of  $n$  elements has  $n!$  arrangements.*

This had a little consideration. Here, we convey our understanding of the Permutations and Factorials section.\*

Given a set of objects  $W = \{a_1, a_2, \dots, a_n\}$ .  $P_n$  is the set of arrangements given  $n$  objects  $a_1, \dots, a_n \in W$ , such as  $\{(a_1, a_2, \dots, a_n), (a_2, a_1, \dots), \dots\}$ . For example, with  $W = \{1, 2, 3\}$ , we have

$$P_3 = \{(123), (231), (312), (132), (321), (213)\}.$$

Method 1, now, moves from  $n = 3$  to  $n = 4$  as follows. For each element in  $P_{n-1} = P_3$ , place element  $a_n$  in each possible vacuous position to arrive at  $P_n = P_4$ , that is

$$P_4 = \{(a_n a_1 a_2 a_3), (a_1 a_n a_2 a_3), (a_1 a_2 a_n a_3), (a_1 a_2 a_3 a_n), \dots, (a_n a_2 a_1 a_3), (a_2 a_n a_1 a_3), (a_2 a_1 a_n a_3), (a_2 a_1 a_3 a_n)\}$$

---

## 5. Accounting for these Arrangements

Adding up all permutations that are so generated we have  $p_n$  the number of all elements in  $P_n$

And again, after some re-view, we sense a need to re-word.  $P_{nn}$  is the set of permuted  $n$ -tuples, and  $P_n$  is the, probably bigger, set of all the  $k$ -tuples with  $k \in \{1, 2, \dots, n\}$ . In other words,  $P_n$  may mean different things, or sets of things. This also applies to quantities that could be denoted like  $p_{nk}$ , and  $p_{nn}$ , and in case of our big wide-awake bean bag, which we sum up to  $p_n$ ; probably.

First, we started with  $p_n = \sum_{k=1}^n k!$  to be the quantity  $p_n$  that accounts for all the elements of arrangements in set  $P_n$ , with  $p_k = k!$  for  $1 \leq k \leq n$ .

However, on the back of some scrap paper, we jotted down  $\{(1), (2), (3), (4)\}$  and saw that  $\{(2), (3), (4)\}$  are not included in our sum, and  $\{(12), (21), (13), (31), (14), (41), (23), (32), (24), (42), (34), (43)\}$  has 10 2-tuples unaccounted for, etc.)

So, for now, given that  $p_{nk} = n(n-1)\dots(n-k+1)^*$ , combined with  $p_n = \sum_{k=1}^n p_{nk}$ , we count the number of arrangements of  $n$  objects to be  $p_n = \sum_{k=1}^n \frac{n!}{(n-k)!}$  or some such like.

## 6. Making concrete Space

We now look at the set  $W$  that we enumerated above and apply method 1 to arrange things.

Given  $W$  as above, we have  
 $Woozy_{41} = \{ ( \text{woozy} ), ( \text{vacuus} ), ( \text{sleepy} ), ( \text{wide-awake} ) \}$

Then, taking one step at a time and applying method 1, given the set  
 $Woozy_{11} = \{ ( \text{sleepy} ) \}$  together with another element, wide-awake  $\in W$ , and we get  
 $Woozy_{22} = \{ ( \text{wide-awake, sleepy} ), ( \text{sleepy, wide-awake} ) \}$ .

Let's start counting now. We have

$$P_{21} = Woozy_{21} = \{ ( \text{sleepy} ), ( \text{wide-awake} ) \}$$

$$P_{22} = Woozy_{22} = \{ ( \text{sleepy, wide-awake} ), ( \text{wide-awake, sleepy} ) \}.$$

To sum up we get

$$p_2 = p_{21} + p_{22}, \text{ with}$$

$$p_{21} = 2, \text{ the count for the set of two 1-tuples, and}$$

$$p_{22} = 2, \text{ the count for set set of two 2-tuples that we have created so far.}$$

Compare things with the calculations that we made earlier,

$$p_{21} = \frac{2!}{(2-1)!} = 2, \text{ and } p_{22} = \frac{2!}{(2-2)!} = 2. \text{ and } p_2 = p_{21} + p_{22}$$

$p_2 = \sum_{k=1}^2 \frac{2!}{(2-k)!}$  which has two terms and evaluates to  $p_2 = \frac{2}{1!} + \frac{2}{0!}$ , and it looks better (or is this just an illusion; however,  $1! = 0! = 1$ ).

Let's take our result from section 5 and adjust.

$$\begin{aligned}
 p_n &= \sum_{k=1}^n (n-k+1) * \frac{n!}{(n-k+1)!} \text{ and since} \\
 (n-k+1) &= (n-k+1) * (n-k) * (n-k-1) * \dots * 1 \text{ we can simplify and have} \\
 p_n &= \sum_{k=1}^n \frac{n!}{(n-k)!} \text{ which, for our state,} \\
 &\text{yields the following sum in two terms, (given that } 0! = 1) \\
 p_2 &= \frac{2}{1} + \frac{2}{1} = 2 + 2 = 4, \text{ which agrees with our permutations' making.}
 \end{aligned}$$

And while we are here we set a solid base by calculating the simple case for the set  $P_1$  for which  $p_1 = 1$ , as we have counted just now.

$$p_n = \sum_{k=1}^n \frac{n!}{(n-k)!} \text{ with } n = 1 \text{ yields } p_1 = \frac{1!}{(1-1)!} = 1 \text{ and confirms the basic case.}$$

So, does our formula hold its stepping up. Assuming that  $p_n = \sum_{k=1}^n \frac{n!}{(n-k)!}$  is correct, we need to find the terms to make  $p_{n+1}$  from that. (to be continued)

## 7. A few observations to count

$$p_{22} = p_{21} = 2$$

$$p_{33} = p_{32}$$

$$p_{nk} = n(n-1)\dots(n-k+1) = \frac{n!}{(n-k)!}$$

$1! = 0! = 1$  seems a reasonable cause, since  $(n - (n-1))! = 1! = 1$  and  $(n - n)! = 0! = 1$ .

$p_{32} = 2p_{31}$  as  $p_{31} = 3$  and  $p_{32} = 6$  and it appears that is on the same ground as the previous line of reasoning; the nature of  $x!$  being  $x(x-1)\dots 3 * 2 * 1$ , while with increasing  $k$  the positive integer sequence is a steady factor. (to be re-worded)

So,  $p_{n2} = 2p_{n1}$ ,  $p_{n3} = 3p_{n2}$ , and  $p_{n4} = 4p_{n3}$ , or some such like. (Well, probably it is not a conjecture that will turn out to be true.)

## 8. The Series of Sequences

$$\begin{pmatrix} \frac{4!}{(4-1)!} \end{pmatrix}, \quad \begin{pmatrix} \frac{4!}{(4-2)!} \end{pmatrix}, \quad \begin{pmatrix} \frac{4!}{(4-3)!} \end{pmatrix}, \quad \begin{pmatrix} \frac{4!}{(4-4)!} \end{pmatrix} \\ \begin{pmatrix} \frac{24}{6} \end{pmatrix}, \quad \begin{pmatrix} \frac{24}{2} \end{pmatrix}, \quad \begin{pmatrix} \frac{24}{1!} \end{pmatrix}, \quad \begin{pmatrix} \frac{24}{0!} \end{pmatrix} \\ (P_{41} = 4), (P_{42} = 12), (P_{43} = 24), (P_{44} = 24)$$

$$\{ ( \text{sequence, series} ), ( \text{Folge, Reihe} ) \}$$

$$\{ 1 \ 2 \ 3 \ 4 \}$$

$$\{ ( \text{woozy} ), ( \text{vacuous} ), ( \text{sleepy} ), ( \text{wide-awake} ) \}$$

$$\{ ( \ 1 \ ), ( \ 2 \ ), ( \ 3 \ ), ( \ 4 \ ) \}$$

$$\{ ( \ 12 \ ), ( \ 21 \ ), ( \ 13 \ ), ( \ 31 \ ), ( \ 14 \ ), ( \ 41 \ ), ( \ 23 \ ), ( \ 32 \ ), ( \ 24 \ ), ( \ 42 \ ), ( \ 34 \ ), ( \ 43 \ ) \}$$

$$\{ ( \ 312 \ ), ( \ 132 \ ), ( \ 123 \ ), ( \ 321 \ ), ( \ 231 \ ), ( \ 213 \ ), ( \ 412 \ ), ( \ 142 \ ), ( \ 124 \ ), ( \ 421 \ ), ( \ 241 \ ), ( \ 214 \ ) \}$$

We find a 3-tuple, take its inverse, then cycle down. These are order 3 cycles. Then, we find another 3-tuple that is not yet noted, and go back to the first step, until all cycle routes have been followed.

```

123 321
231 213
312 132
    124 421
    241 214
    412 142
        134 431
        341 314
        413 143
            234 432
            342 324
            234 243

```

We find four order three cycles and their respective inverse things (we may call, arbitrarily, the first in its row the *id* of its cycle, while the other jumbles in the row follow their leader. Maybe *chief* is a more appropriate designation than *id*.)

3-cycles

123	231	312	
321	213	132	
124	241	412	
421	214	142	
134	341	413	
431	314	143	
234	342	423	
432	324	243	

$\{ 1234, 2341, 3412, 4123, 4321, 3214, 2143, 1432, 2134, 1342, 3421, 4213, 4312, 3124, 1243, 2431, 1324, 3241, 2413, 4132, 4231, 2314, 3142, 1423 \}$

Again, we find three 4-cycles. We reverse to form their inverse. We follow the four permutation instances that are specified by these six order four canonical cycle permutations.

As an additional step, here, in order to give some visual clue as to the uniqueness of each 4-tuple, we have ordered the said permutation cycles to list the canonical cycle representation as the first element of its row. (As a permutation, each element in each of the six rows below will permute the standard permutation, say the 4-tuple 1234, to the identical resulting arrangement.)

How significant is this? We aim to find an understanding of how we may abstract this in the context of group theory. Given the 24 permutations listed, we have only six group elements. Each has four different representations. For example, the group's elements 3412 and 4123 are equal because the permutation  $(1234) \circ (3412) = (2341)$  is equal to  $(1234) \circ (4123) = (2341)$ .

1234	2341	3412	4123	
1432	4321	3214	2143	
	1342	3421	4213	2134
	1243	2431	4312	3124
		1423	4231	2314 3142
		1324	3241	2413 4132

4-cycles

## 9. A Group of Permutations

We fill the vacuous bag with four words to make a start. Let  $W$  be the set that we made earlier, namely  $\{ \text{woozy, vacuous, sleepy, wide-awake} \}$ .

Next we make four sets of permutaions  $P_{nk}$  with  $k \in \{k|1 \leq k \leq n\}$ ,
